Carcinogenicity The IARC evaluated ingested nitrate as a Group 2A carcinogen, for which there is

inadequate human evidence for nitrate in food or drinking-water and inadequate animal evidence for nitrate, but limited human evidence for nitrite in food, limited animal evidence for nitrite and sufficient animal evidence for nitrite in combination with amines or amides. A

part of ingested nitrate is changed to nitrite in the body.

However, no ingestion of nitrate is expected under intended use of this product.

Reproductive Toxicity No data available

STOT - single exposure No data available

STOT - repeated exposure No data available

Aspiration hazard No data available

Other Information Ingested nitrate may cause effects on the blood, resulting in formation of methemoglobin.

However, no ingestion of nitrate at a level which causes such adverse effects is expected

under intended use of this product.
